We are on the Internet  www.keepriterefrigeration.com

Air Cooled Models from 103 Thru 164
Four to ninety Ton

- Galvanized steel, angular steel frame cabinet construction
- Removable access panels
- Galvanized steel fan housings and wheels.
- 12" (305mm) diameter fan wheels keyed to fan shaft
- Direct drive fan motors with inherent overload protection.
- Weather protected motors with top end rain shields and shaft moisture slingers.
- High efficiency rippled aluminum fin coils
- Adjustable motor bases and drives

SELECTION DATA

The selection of an air cooled condenser is based on the heat rejection capacity at the condenser rather than net refrigeration effect at the evaporator because the refrigerant gas absorbs additional energy in the compressor. This additional energy, the heat of compression, varies appreciably with the operating conditions of the system and with compressor design, whether open or suction cooled hermetic type.

Some compressor manufacturers publish heat rejection figures as part of their compressor ratings. Since heat rejection varies with compressor design, it is recommended that the compressor manufacturer's data be used whenever available in selecting an air cooled condenser.

If the compressor manufacturer does not publish heat rejection ratings, factors from Table Nos. 4 and 5 may be used to estimate total heat rejection-THR.

For systems outside the normal limits of single stage compressor application, (such as compound or cascade refrigeration systems) the following formulas may be used to arrive at the heat rejection requirements for selection of the condenser:

Open Compressors

$$\text{THR} = \text{Compressor Capacity (Btuh)} + 2545 \times \text{Bhp}$$

Suction Cooled Hermetic Compressors

$$\text{THR} = \text{Compressor Capacity (Btuh)} + 3413 \times \text{KW}$$

HEAT REJECTION FACTORS

CONDENSER LOAD = COMPRESSOR CAPACITY X FACTOR

OPEN COMPRESSORS

SELECTION EXAMPLE

GIVEN:

Compressor Capacity 350,000 Btuh
 Evaporator Temperature 40°F.
 Refrigerant R-22
 Ambient Air 95°F.
 Maximum Condensing Temperature 120°F.
 Suction Cooled Hermetic Compressor

PROCEDURE:

- Assuming the compressor manufacturer's heat rejection data is not available, determine the heat rejection factors for the specified conditions from Table No. 5 above (1.27).
- Multiply the compressor capacity by the heat rejection factor to estimate the required condenser capacity.

- Since R-22 is specified, select the proper condenser from Table No. 1 based on the specified difference between condensing refrigerant and the ambient air (T.D.).

SELECTION:

Using the heat rejection factor from Table No. 5 above, the required condenser capacity is:

$$1.27 \times 350,000 = 444,000 \text{ Btuh}$$

From Table No. 1 for the specified T.D. of 25°F the proper selection is the Model KCC 237 with a capacity of 536,600 Btuh. In this instance the condenser is slightly oversized and the condenser will balance the compressor heat rejection at less than the maximum condensing temperature of 120°F.

MULTIPLE COMPRESSOR APPLICATIONS

Multi-section units are available for applications where more than one compressor is used either on the same system or separate systems. Usually, this arrangement will result in lower installation costs as opposed to using separate units. Coils for multi-section condensers are factory circuited

and divided into the proper number of sections, each sized to meet the specified capacity. Each circuit is supplied with a hot gas inlet and liquid outlet connection and tagged for identification. The fan on a multi-section unit should remain operative as long as a condensing requirement exists in any section of the coil.

TABLE 6 HEAT REJECTION CAPACITY PER FACE TUBE (BTU / HR) - R12

KCC MODEL NO.	FACE TUBES	°F. (°C) TEMPERATURE DIFFERENCE = CONDENSING TEMPERATURE MINUS AMBIENT TEMPERATURE					
		1 (6)	10 (6)	15 (8)	20 (11)	25 (14)	30 (17)
103	12	150	1502	2252	3003	3754	4505
104	14	194	1943	2914	3885	4856	5828
106	16	245	2447	3670	4893	6116	7340
108	22	236	2363	3544	4725	5906	7088
111	22	315	3150	4725	6300	7875	9450
214	22	402	4022	6032	8043	10054	12065
217	22	477	4767	7151	9534	11918	14301
222	26	500	4998	7479	9996	12495	14994
228	26	630	6300	9450	12600	15750	18900
237	34	630	6300	9450	12600	15750	18900
141	40	630	6300	9450	12600	15750	18900
150	46	630	6300	9450	12600	15750	18900
164	58	626	6258	9387	12516	15646	18774

For R-404A ratings, multiply above capacities by 0.97.

SELECTION EXAMPLE

GIVEN:

Six hermetic compressors with capacities and evaporator temperatures (tabulated below).
 Refrigerant R-22
 Ambient Air Temperature 100°F.
 Maximum Condensing Temperature 120°F.

PROCEDURE:

1. Tabulate the compressor capacities, evaporator temperatures and heat rejection factors for each compressor. (See Sample Tabulation, below.)
2. Determine the required heat rejection capacity for each compressor.
3. Total the sectional heat rejection capacities for the six compressors.

SELECTION:

Based on the total heat rejection capacity for the six compressors of 186,160 Btuh, it can be seen from Table No. 6 that the smallest unit which will meet this requirement is the Model KCC217 with 210,000 Btuh

at 20 °F. T.D. Table No. 6 lists the heat rejection capacity per "face tube" at various T.D.'s.

At 20 °F. T.D., the KCC 217 has a capacity of 9534 Btuh per "face tube". To determine the required number of face tubes for each section, divide the required sectional capacity by the capacity per "face tube". For example, compressor No. 1 requires $18,000 \div 9534 = 2$ "face tubes". Section No. 1 should be eircuited with 2 "face tubes" for Compressor No. 1. Following this same procedure will determine the size of each section for the remaining compressors.

The sample tabulation shows the results of this selection and indicates that 22 "face tubes" are required when using the Model KCC 217. Since the Model KCC 217 has 22 "face tubes" available, the selection has been satisfied. If the total required number of "face tubes" exceeds the number of "face tubes" available as listed in Table No. 6 it will be necessary to permit a slightly higher condensing temperature than planned for one or two of the sections. A second alternative would be to select the next larger size condenser.

SAMPLE TABULATION

INSTALLATION INSTRUCTIONS

IMPORTANT THE FOLLOWING KEEPRITE REFRIGERATION CENTRIFUGAL FAN UNITS **MUST** BE
PLATFORM OR FLOOR MOUNTED
CONDENSERS KCC237, KCC141, KCC150, KCC164

GENERAL

Unit should be carefully checked for damage when received. Visible or concealed damage should be reported immediately to the carrier and a claim filed.

All KCC Centrifugal condensers are inspected thoroughly before shipment. However, fans and shaft should be inspected before installation to insure that misalignment has not happened in shipment or handling. For long and trouble free life, the units should have proper care and maintenance.

Units should be located so that enough space is left around the unit for lubrication, belt adjustment and coil removal if necessary.

For units with free air intake and discharge, care should be taken to insure that there are no obstructions that will interfere with the air flow.

DRIVE INSTALLATION

Smaller motors are usually shipped mounted on the unit. Larger motors will be shipped separately. When motors are shipped separately the mounting procedure should be as follows:

- (a) Bolt motor to the motor base on the unit.
- (b) If not already mounted, install fan motor sheaves.
- (c) Align sheaves with straight edge to insure true running belts.

- (d) Adjust motor mount for proper belt tension.
- (e) Attach belt guard to end panel of blower section.

MOUNTING UNITS

Smaller models may be floor mounted or ceiling hung. Larger models may be floor mounted only. When hoisting units, a spreader bar should be used to prevent damage to the casing. Units are equipped with 5/8 " (16 mm) N.C. tapped hanger nuts or 3/4 " (19 mm) anchor holes for floor mounting.

DUCTWORK

Where ductwork is to be used with units, connection to unit should be made with flexible canvas sleeves.

MAINTENANCE BEFORE START UP

- (a) Check tightness of all bearing, sheave and fan wheel set screws.
- (b) If fan wheel set screws are loose, check to insure that Wheel is not rubbing in housing.
- (c) Leak-test system to make sure that all joints are tight.
- (d) Ball bearings are pre-lubricated and require no further lubrication at start-up.
- (e) Rotate shaft by hand to make sure it runs freely.
- (f) Check fan and motor for correct rotation. If running the wrong direction, reverse phases at motor. Re-check rotation.
- (g) Check drive alignment and belt tension.

AFTER FIRST 48 HOURS

1. Check all previous points under "Before Start-Up".
2. Belts will have stretched. Re-check tension and adjust motor where necessary.

PERIODIC SERVICE & MAINTENANCE

- (a) Check all moving parts for wear every 6 months.
- (b) Check bearing collar set screws for tightness every 6 months.
- (c) Check belt tension and adjust if necessary.

MOTOR BEARINGS

All ball bearings are pre-lubricated and do not require any additional grease at time of installation. However, periodic cleaning out and renewal of grease is necessary. Please note extreme care must be taken to insure that foreign matter does not enter the bearing. It is also important to avoid over greasing. Only a high grade clean mineral grease should be used. Specific greasing instructions should be in accordance with the motor manufacturer's recommendations. Melting point of grease should not be under 150°C (302°F).

FAN BEARINGS

All ball bearings are pre-lubricated and do not require any additional lubrication at time of installation. However, periodic cleaning out and renewal of grease is necessary. Internal bearings are accessible through access

panel in cabinet. Units are equipped with extended lube lines and will have grease fittings for internal bearings on drive end panel of blower section. Apply grease when bearings are running, adding slowly until a slight bleeding of grease from the seals is noted. Access door should be removed so that internal bearing may be viewed when greasing.

DO NOT OVER LUBRICATE

The lubrication interval varies with the period of operation and temperature of the ambient air. The following interval is recommended:

Temperature Range	Time Interval
60 - 80°F (16 - 26°C)	2 years
81 - 100°F (27 - 37°C)	1 1/2 years
101 - 120°F (38 - 49°C)	1 year

For units which have been in operation for several years or where some bearing wear has occurred through adverse operating conditions, lubrication may be required as frequently as every 2 months.

ARMVAC 781 available from Standard Oil Company or Imperial Oil Company is the recommended lubricant for fan shaft bearings. Lubricant will be satisfactory down to -40°F (-40°C) ambient temperature.

REPLACEMENT PARTS

When replacement parts are required, furnish factory with Unit Model No. and Serial No. as shown on drive end of unit.

DESIGN SPECIFICATIONS

TYPE KCC CENTRIFUGAL FAN AIR COOLED CONDENSERS

CASING

Furnish and install where shown on the drawings, Centrifugal Fan Air Cooled Condenser(s) by KeepRite or approved equal. Sizes and performance shall be as indicated in the unit schedule. Cabinets shall be of sectionalized construction, and all sheet metal parts, including accessories, shall be of continuous galvanized sheet steel. Cabinet shall be angular steel frame construction with casing panels easily removable for access to the interior of the unit.

FANS

Fans shall be designed for class 1 operation. Fan ratings shall be based on fan tests conducted in accordance with AMCA Code No. 210. Fan housings and wheels shall be continuous galvanized steel. Fan wheels over 12 " (305mm) diameter shall be keyed to the fan shaft. The fan shaft shall be solid high carbon steel, fully sized throughout.

The maximum rate of fan RPM shall be well below the first critical fan shaft speed.

BEARINGS

Bearings shall be self-aligning, grease lubricated, ball type. All bearings shall be sized with a

minimum service factor of four. Extended lubrication lines with zerk type fittings shall be provided and permanently lubricated bearings will not be allowed.

COILS

Coils shall be constructed of rippled aluminum fins hydraulically bonded to copper tubing for permanent metal-to-metal contact and maximum heat transfer efficiency. Fins shall be die-formed with wide smooth collars to completely cover the tubing for optimum corrosion resistance. Coils shall be factory leak tested at 300 psi, dehydrated, sealed and braced to seamless copper headers. Any number of coil circuits shall be available provided the total does not exceed the number of tubes in the coil face. Coils shall be provided with sweat-type connections and shall be circuited for proper refrigerant drainage.

DRIVE

Units shall be provided with adjustable motor bases and adjustable drives so as to permit 10% adjustment in fan speed in either direction. Factory supplied and mounted motor electrical characteristics: 208, 230 or 575/3/60.
