JBF Hot Gas and Electric Defrost Blast Freezers 60Hz

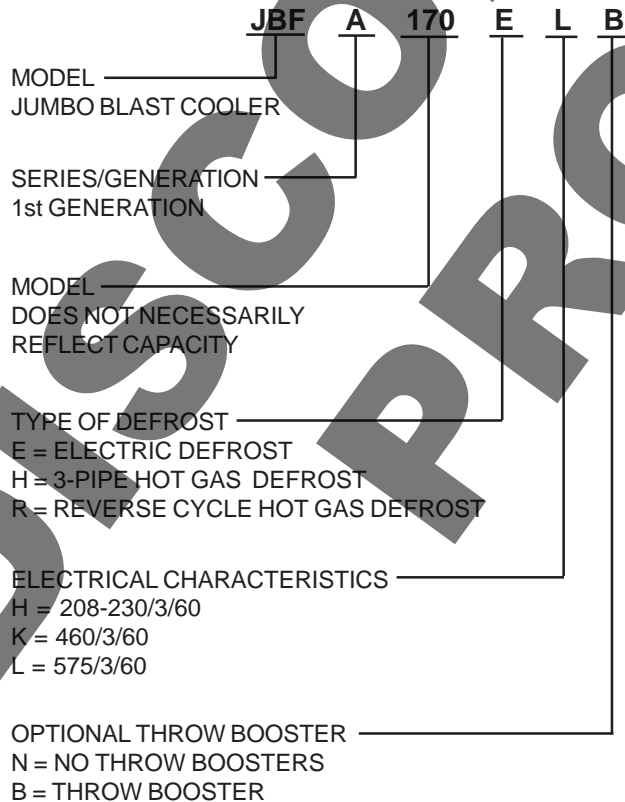

Medium and Low Temperature Applications -40 °F (-40°C) and Higher

Electrical Power: 208-230/3/60, 460/3/60, 575/3/60

- Incoloy defrost heaters mounted in slots on both sides of cooling coils. (electric defrost models only)
- Drain pans on stainless steel hinges for easy access. (electric models only)
- Factory installed fan delay and defrost termination thermostat.
- Rugged high efficiency cast aluminum air foil fans.
- Hinged side panels allow easy access for refrigeration circuit and electrical compartment.
- Schrader fitting and external equalizer line.
- Plug-in motors with moulded lead and connector.
- Unit is shipped upright for convenient handling and quick installation.
- Corrosion resistant, easy to clean vinyl coated fan guards.
- Electrical terminals with recessed connections for dependable operation.

HOT GAS DEFROST DIMENSIONS AND WEIGHTS

INSTALLATION INSTRUCTIONS

INSPECTION

Careful inspection of all parts when received for loss or damage in transit is very important - Remember, you, the consignee, must make any claim necessary against the transportation company. Shipping damage or missing parts, when discovered at the outset, will prevent later unnecessary and costly delays.

Ensure that the electrical characteristics are as ordered. Save all tags and instruction sheets for reference by installer and owner.

LOCATION

The unit location in the room should be selected to ensure uniform air distribution throughout the entire space to be refrigerated. Make sure that the fan does not blow directly out or pull in through an opened door and that the product does not obstruct the free circulation of air.

When installing the unit adjacent to a wall, sufficient clearance must be provided to allow free air movement to the coil.

Clearance must be provided at each end of the unit to

allow access to refrigerant piping and electrical compartment.

See dimensional drawings for clearance requirements.

INSTALLATION

Note: These units draw air through the coil and discharge air from the fan side

JBF Blast Freezers are supplied with shipping legs to allow units to be shipped in an upright position. Units are lifted into place with shipping skid attached to mounting legs.

Slotted hanger brackets take 1/2" (12.7mm) hanger rods. For fast, convenient mounting, install washer and nuts on hanger rods prior to lifting units. Rods may be lifted into slots and are held securely in place by tangs on hangers

After unit coolers are hung in place, remove shipping legs from units by removing the two 5/16" (8mm) bolts from each shipping leg.

Note: Shipping legs must be removed to allow hinged drain pan to open.

INSTALLATION INSTRUCTIONS

DRAIN LINE

If unit cooler is mounted flush to ceiling, the staggered high hanger will provide a positive pitch for drainage of condensate and defrost melt water.

If units are suspended below the ceiling, the installer should provide adequate pitch to the unit by adjusting the location of the hanger rod nuts.

Note: Check for adequate drainage by pouring water into the drain pan.

Insulated copper tube should be run from the drain connection, sloping at least 4" (102mm) per foot. A trap outside of the room will prevent warm air entering through the tubing. Connection should be made to proper drainage facilities that comply with local regulations.

It is necessary to heat the drain line to prevent condensate from freezing in the drain line. Electric heating cable or electric tape (by others) is used for this purpose. The drain line heater should be connected for continuous operation; it is also recommended that the drain line be insulated. A heat output of 20 watts per lineal foot of 1" (25mm) drain line in a 0°F (-18 °C) room is usually satisfactory. 115 volt cable and tape is available from your local refrigeration wholesaler. Two 115 volts heaters (by others) of the same wattage may be wired for use on 230 volt system

ELECTRICAL

Wire system in accordance with governing standards and local codes. See wiring diagrams for unit cooler wiring diagram and typical system wiring schematic.

Note: Electrical wiring is to be sized in accordance with minimum ampacity rating.

The defrost termination thermostats, fan delay thermostats and defrost heater safety thermostat are factory supplied and factory wired to a terminal block. See component identification diagram on wiring diagram for electrical compartment arrangement.

A hinged end panel provides quick access to the electrical compartment.

AFTER START UP

1. Check the oil level to be sure the oil charge is correct.
2. On the initial start up, the fans do not start until coil temperature is pulled down to approximately 26 °F (-3 °C)
Also, it is normal for the fans to cycle a few times until the room temperature is pulled down.
3. Make sure that the expansion valve is properly set so that the coil frosts evenly all the way through.
4. Heavy moisture loads are usually encountered when starting the system for the first time. This will cause a rapid build-up of frost on the unit cooler. During the initial pull down, we suggest that the frost build-up be watched and defrosted manually as required.

MAINTENANCE

1. Periodic checking and cleaning of the coil surface when necessary should be done, using a whisk or brush. Drain pans are hinged to provide convenient access to the inside coil surface.
2. Motors are permanently lubricated type and require no further lubrication.

REFRIGERATION SYSTEM

Refrigerant line sizes are important and should be the same size as the coil connections, or larger, depending on the length of run. Consult recommended refrigerant line sizes charts (KeepRite Refrigeration Engineering Manual or other recognized sources of information) when sizing refrigerant lines.

Refrigerant piping and control systems should be designed to prevent possible liquid slugging of the compressors on start-up after the defrost cycle.

Select an externally equalized expansion valve best suited to the coil and the application on the basis of the manufacturer's ratings. Install the expansion valve in the refrigeration piping compartment.

A 1/4" (6mm) O.D. equalizer line has been provided for the externally equalized expansion valve connection.

A Schrader valve fitting is supplied at the suction gas header to provide convenient pressure readings.

The refrigerant distributor is sized and installed at the factory and is supplied with a factory sized nozzle.

A hinged end panel provides quick access to the refrigeration piping compartment.

SYSTEM CHECK

1. All wiring should be in accordance with local codes.

2. All refrigerant lines should be properly sized and checked for any possible leaks.

3. Be sure system is charged with the proper refrigerant.

4. Make sure that the expansion valve thermal bulb is securely strapped to the suction line.

5. The system should include a liquid line drier and strainer.

6. The suction, discharge and receiver service valves must be open.

7. Check that the fans turn freely and turn in clock wise rotation.

8. Pour enough water into the drain pan to allow a good check on drainage and seal the trap.
