PCC Horizontal Product Coolers

Air Defrost for Applications 35 °F (1.6 °C) (Electric and Hot Gas Defrost Models are Optional)
Up to 30 Tons Nominal Capacity

- Large face area centrifugal fan
- New “bolt-on” coil for maximum capacity in a minimum space.
- Electronically balanced high efficiency fans with forward curved blades provide quiet operation.
- Heavy gauge galvanized steel cabinet.
- Self-aligning ball bearings and heavy channel stiffeners eliminate vibration and ensure quiet operation.
- Full size access doors for easy maintenance.

* For Applications in room temperatures above 35 °F (1.6 °C) maximum face velocity should not exceed 500 FPM (152m/min) and capacities corrected accordingly (see table 1 for correction factors).

** These ratings are based on moderate coil frosting. For heavy frosting use factor of 0.95.

(1) "T.D." - Represents the difference between temperature of air entering cooling coil and coil refrigerant temperature.

Ratings for units using electric defrost may be determined by multiplying ratings in above table by 0.95

12	.27	.34	.41	.39	.49	.59	.53	.67	.81

** Coil face velocity should not exceed 500 FPM (152 m/min.) for applications where room temperature is above 35 °F (1.6 °C).

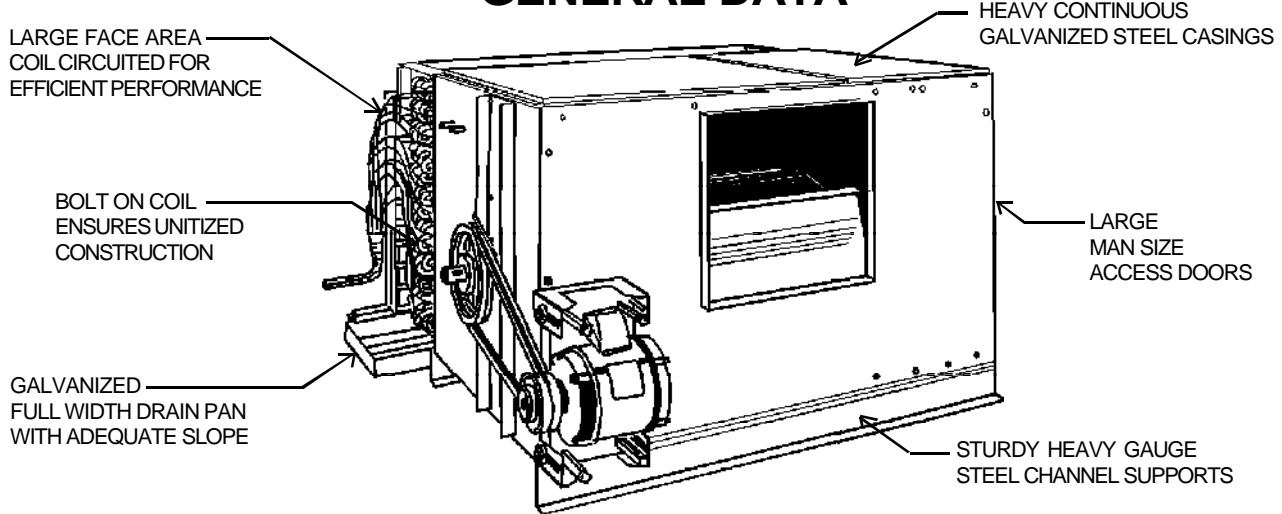

WET COIL CORRECTION FACTOR*

Ent. Air Dew Point Minus Refr. Temp.	
10°F (5.5°C) or Less	11°F (6.1°C) to 18°F (10°C)
1.12	1.24

* For medium frosted coil, use factor of 1.3

Example:
 600 FPM (183 m/min.), 8 row coil 4 fins/in.
 Evap. Temp. 40 °F (4.4 °C)
 Ent. Air Dew Point 45 °F (7.2 °C)
 Internal Airside Resistance - .35
 Wet Coil Correction factor = 1.12
 Total Internal Airside
 Resistance = 1.12 x .35 = .392

DIMENSIONAL DATA

DIMENSIONAL DATA

MODELS PCC 870 THRU PCC 2870 MODELS PCC 3770 THRU PCC 6470

Note: All units viewed from drive end.

1, 2, 3 & 4 indicate available motor locations. Standard access panel is opposite drive end. Additional access panels available at locations A, B or C.

* Not Available on units PCC 2270 and PCC 2870.

STANDARD ON ALL MODELS

INSTALLATION INSTRUCTIONS

GENERAL

The Product cooler should be carefully inspected for damage when received. Visible or concealed damage should be reported immediately to the carrier and a claim filed for damage.

Product coolers are constructed from heavy gauge galvanized steel and are thoroughly inspected before leaving the plant. Care should be taken during installation to prevent damage to the units.

Care should be taken to ensure that sufficient access is available for servicing of the unit. Space should be available for lubrication, belt adjustment and coil removal.

Fans and fan shafts should be inspected before start-up. Fans are inspected before leaving the plant; however, rough handling may cause misalignment.

LOCATING AND INSTALLATION HINTS

IMPORTANT: Product Coolers PCC3770, PCC4170, PCC5070 and PCC6470 **MUST** be platform or floor mounted.

Product Coolers may be placed in any suitable manner in the room. However, low temperature units **should not** be located over entrance doors, because of the heavy frosting that will occur on the coils.

All Product Coolers must be installed level to ensure proper drainage of water from the pre-engineered drain pan.

Drain lines for all Product Cooler Models should be pitched 45° and should be as short as possible. To prevent drain line freezing problems the following recommendations should be carried out:

- (a) Use a drain line heater (supplied by others) with a density of 20 watts per foot. Six to eight feet of cable per foot of drain line is recommended.
- (b) Drain line heater should **make at least** a full turn round the outlet of the drain pan.
- (c) The heated drain line should be insulated.
- (d) The drain line should be provided with a trap outside the freezer room. Traps should be filled with water before initial start-up.

DEFROSTING

Product Coolers are obtainable with electric or hot gas defrost systems. On hot gas defrost units, the

distributor on the evaporator coil is equipped with a side port connection to facilitate a hot gas connection. Distributor tubes are oversized for hot gas operation.

A liquid line solenoid valve (supplied by others) should be used so that evaporator coil may be pumped out before each defrost cycle.

The following defrost control (supplied by others) methods may be used with Product Coolers.

(1) TIME INITIATED- TEMPERATURE TERMINATED

When using a time initiated - temperature terminated method of defrosting a Paragon Timer 8145-20 or equal is recommended for this application. Timer is used in conjunction with a defrost termination thermostat. For 3 phase applications, the timer must be used with a contactor. As well as the defrost termination thermostat, the timer will also have a fail safe feature built into unit.

The defrost termination thermostat should be set at approx. 35 °F (1.6 °C) and should be adjustable. Differential should be 5 °F (2.8 °C) or less. Bulb should be attached to a tube of the evaporator. As a part of this system, a fan delay thermostat should be used to provide a delay period between the end of the defrost and the start-up of the fan. The fan delay thermostat should be adjustable and set at 10-25 °F (5.6-13.9 °C) (depending on application) and bulb should be attached to evaporator tube. When installing thermostats, care should be taken to ensure that bulbs are not attached to evaporator heater tubes.

(2) TIME CONTROLLED OPERATION

Defrosting may also be carried out by a time controlled sequence. This system utilizes a timer and fan delay thermostat. Timer should have an adjustable length of defrost from 2-110 minutes and should be Paragon 8045-20 or equal. Fan delay thermostat should be as indicated in (1) above.

Initially, 4-30 minute defrost per day are recommended. However, it is important that the coil be completely cleared of defrost at the end of the cycle. Should coil not be cleared of all frost at the end of 30 minutes, more frequent defrost of shorter duration should be used.

WIRING

For suggested wiring of defrost heaters see Drg. No. 41594D furnished with Product Cooler.

INSTALLATION INSTRUCTIONS

START - UP

- (a) Before start-up equipment, the amperage of all electric defrost heaters, including drain pan heaters, motor, etc. should be checked to ensure satisfactory operation.
- (b) Leak test entire system and make sure all joints are tight.
- (c) Check fan and motor for correct rotation.
- (d) Check alignment of fan and motor sheave and belt tension. Belts should have approx. 1" deflection.

will have grease fittings located on unit panel. Specific greasing instructions should be carried out in accordance with tags and labels attached to unit. Care should be taken not to over lubricate. Grease should be applied when unit is running, adding slowly until there is a slight bleeding of the grease at the seals.
For continuous operation in clean areas, in an operating temperature range from -40 °F (-4 °C) to 140 °F (60 °C), normal lubrication interval is six months.

ARMVAC 781, available from both Standard Oil Company and Imperial Oil Company is the recommended lubricant for all product cooler shaft bearings.

PERIODIC SERVICE AND MAINTENANCE

- 1. Check all moving parts every six months for wear.
- 2. Check bearing collar set screws for tightness every six months.
- 3. Fan bearings are pre-lubricated and do not require lubrication at time of installation. Extended lube lines

REPLACEMENT PARTS

When replacement parts are required on units manufactured by KeepRite Refrigeration, furnish factory with unit model number and serial number as shown on serial plate on drive end blower section.
